**Compiled Literature Report on Selected Health  
Conditions in Lebanon**

Prepared By:

***Hilda Harb***, MPH

**December 2004**

## **ACKNOWLEDGEMENTS**

Lots of efforts versed into the preparation of this report. It would not be possible to thank everyone who helped in the preparation. Special gratitude goes to Dr. Walid Ammar, Director General of Health for his support.

The gratitude is extended to Dr. Iman Nuwahid and Dr. Abla Sibai, from the American University of Beirut who laid the first building blocks for this report.

Ms. Oumayma Rammal, and Ms. Aida Farha were extremely helpful in giving much of their time to help in Library search.

Last but not least, special thanks are forwarded to Ms. Mary Farah-Madbak for her devoted assistance in the majority of the search done.

Apologies for all those who should have been thanked, and were not.

## **CHAPTER ONE:**

### **Introduction and Methodology**

## **Introduction:**

The progressive rise in average age at death in virtually all populations has prompted the necessity to reconsider how the health of populations is measured. In many populations across the globe, there is considerable uncertainty in whether gains in life expectancy have been accompanied by improvement in health status.

The epidemiological transition, in addition to uninformative aspect of the average life expectancy at birth, have paused a question mark on health measurement and assessment of health indicators. In order to better plan the provision of health services, measures of survival/mortality and measures of health status should be combined in a way to provide a holistic measure of population health. In that line of thinking, the burden of disease idea has emerged. The idea behind a Burden of Disease study has for primary aim to combine information on mortality, measured as YLL (Years of Life Lost to death), and non-fatal health outcomes, measured as YLD (Years of Life Lost to Disability), into one summary measure of population health; namely, the DALY (Disability Adjusted Life Years). DALY is thus, a modified life expectancy at birth taking into account the load of both, the mortality and the morbidity in the country.

The intended applications of DALY as a summary measure are many. As a shortlist I mention:

1. Monitoring changes in the health of a given population
2. Comparing two different population health status
3. Informing debates on priorities for research and development
4. Informing debates on priorities for health service delivery and planning
5. Analyzing the benefits of health interventions for use in cost-effectiveness analyses.

In Lebanon, there exist major deficiencies in the knowledge of the magnitude of health problems; especially in view of the epidemiological transition we are passing through, and after the long years of civil war. DALYs, and because of their potential influence on national and international decisions, are of critical importance in Lebanon.

The ideal situation for assessment of the magnitude of a specific health problem is to conduct national studies and surveys. But, in view of the limited financial and manpower resources, the next best alternative would be to assess the present situation at the level of existing knowledge of the mortality and morbidity load of selected health problems of priority, to be able to identify the gaps.

This report is the second of a status review of published information, and available but unpublished data on selected health problems in Lebanon. The first report was done by Nuwayhid and Sibai for the WHO in 2002. In addition, it was agreed in the Burden of Disease meeting of April 2004 in Cairo, to have a repository in the region of all the studies that could contribute, as a whole, or in part, to the BOD work. This report represents a complementary work and an update to the previous review, but this time complete text articles and studies are organized and compiled as appendices to the main review report.

## **Selection of Health Problems:**

The selection of the health problems has undergone many activities. A checklist was first administered to colleagues at the Ministry of Public Health; namely, Medical Doctors from the

Medical Audit Committee in view of their direct contact with bills of patients admitted to private hospitals at the expense of the ministry. This was supposed to be a pilot test to be generalized to the Board Of Medical Doctors. Major problems encountered were that the doctors were from different medical specialties, and hence they rated some diseases differently. The second activity involved was an interdepartmental advisory meeting in the Preventive Medicine Directorate to pause the issue. This latter still paused other problems as to the priority of diseases being put for discussion among such a small group of experts, not to mention the questioning of the importance of the National Burden of Disease study in the first place. So, holding a workshop was proposed to prioritize the diseases. At this stage, a decision was taken to build upon the diseases and health problems that were first selected to be of utmost priority during the July 2000 workshop, and over which the work of Nuwayhid and Sibai in January 2002 was built. Hence, this will update and complement the previous work. The rationale behind this decision was, on one hand, to stick to the terms of reference and the constraint of time; and on the other hand, the health profiles of countries don't change rapidly over time. In addition, the general search of literature will make it clear as to what are the health problems that are subject to research more than others, and which will contribute to the bulk of the review.

### **The Search:**

The following resources were reviewed for published articles, covering the period from 1990 till 2004

- Medline search, an international Database of all articles published in more than 3000 medical and health journals.
- PubMed, with Lebanon [mesh].
- The National Health Information Center (a center run by WHO-WR office), manual and computer search
- The health and medical Libraries of the Saint Joseph University
- The Lebanese corner at Saab Medical Library. A collective review of all the studies, published and unpublished, that were done in Lebanon concerning the relevant topics during the time period specified. Part of this comprised a manual search in compiled filing cabinets that are not indexed yet (1997-2004).

In addition to publications and library reports, available reports done at governmental and non-governmental institutions, as well as studies undergone on MedNet Liban database were searched. MedNet is a big private insurance company (comprising 24 small companies). The literature was selected and filtered as to its relevance to the epidemiological profile of the selected diseases.

In addition to this, information was extracted from selected national and regional health surveys, such as the National Household Health Expenditure and Utilization Survey (NHHEUS) 1999, PAP child survey 1996, National Perinatal Survey 2000. Complete copies of the before mentioned publications are provided, in addition to some pages that are included in the appendices.

## **The Review:**

The review tried to tackle all studies done on health problems as identified by the Global Burden of Disease 2000 categorization wherever available and relevant as to their epidemiological meaning.

The subsequent points are worth noting:

1. The references cited might sometimes include some data relevant to health problems of the same nature as the searched one. For example, protein-energy malnutrition, which belongs to the same category with iron-deficiency anemia (nutritional deficiencies), had some information on it included although the search did not take account of it as a separate health problem. In that case, the name of the general health condition was cited as title.
2. Certain health problems are by themselves risk factors to other health problems, they were cited as risk factors (like Hypertension)
3. Some health conditions in the Non-communicable diseases category (like substance abuse) comprised certain risk factors (like alcohol consumption) that would otherwise be tackled alone, but was included as part of the non-communicable disease category.
4. The majority of the literature comprised of theses done by medical or pharmacy students as a completion of their studies, which were most of the times hospital based and of clinical nature, and/or of small sample size which weakened their contribution to the public health profile of the disease.

The following review will be presented as summary findings pertaining to the condition of interest, and the full texts will be appended to the report in three groups as grouped by the BOD study; in addition to a fourth volume relating to risk factors namely:

Volume I: Communicable, Maternal, Perinatal and Nutritional conditions

Volume II: Non-Communicable Diseases

Volume III: Injuries

Volume IV: Risk Factors

It is important to note that the partitioning of the volumes (Volume I, part 1 and 2, and Volume II, part 1, 2 and 3) has no meaning in disease categorization, but was done for the sole purpose of convenience binding.

On the other hand, the studies and reports pertaining to the year 2004 are not all complete due to the timing of the report (end of the year), but will be updated during January 2005. Namely the Ministry of health in-patient hospitalization data, Cancer registry reports for 2003 and 2004; the HIV/AIDS statistics, the Malaria control annual report, the Tuberculosis annual report, all reportable communicable diseases.

Moreover, the statistics of the National Chronic Drugs program, which is the responsibility of the Young Men Christian Association (YMCA), will be ready soon. It is worth noting that, although this program contains rich information, a major defect with the coding system pauses itself. No international or national classification system of disease is used ever since its beginning and to date, which pauses a problem relating to the identification of individual health conditions, in addition to the problem of comparability to other datasets.

Another general problem lies in the denominators. The target populations of certain programs and the beneficiaries of certain services, are not well defined. In that case the data only serves to identify priority health conditions as to those with higher number of cases, but the risk assessment and the prevalence, which are of a more powerful statistical meaning and use, cannot be derived.

## **CHAPTER TWO:**

### **The Ministry of Public Health In-patient Hospital Data**

The visa billing center at the Ministry of Public Health is the place that grants approvals to cover inpatient and some outpatient services at selected hospitals all over the Lebanese territories that have contracts with the Ministry of Public Health . It is a very rich information source that include, in addition to the diagnosis of the condition and the surgical procedures performed (when applicable), the age and sex of the patients and the geographical area from which they are coming. It used to cover 53 hospitals from Beirut and Mount Lebanon for inpatient services up till end 2003. As of beginning 2004, all visas issued all over Lebanon for inpatients covered by the MOPH are registered in that center.

This dataset is of potential use; and though hospital based, it might serve as a building block for assessment of prevalence or incidence of certain acute health conditions in a certain subgroup of population.

The Ministry of Public Health covers the largest part of the Lebanese population, and which is not covered under any health insurance scheme. The percentage eligible for MOPH coverage was estimated by the National Household Health Expenditure and Utilization Survey 1999, to be around 48.3% of the Lebanese population. This proportion, together with estimates of the total population of 4,314,000 for 2003, make the potential beneficiaries of the MOPH covered population of around 2,000,000.

During 11 months in 2004, 93,672 admissions to hospitals at the expense of the MOPH have occurred. The frequencies and percents of admissions by ICD10 groups of codes are provided in the following table in this section, and will be referred to in the specific health conditions in the review. It is worth noting that the percentages don't sum up to 100, but rather to 236% which proves that an admission could have more than one diagnosis.

Prevalence per thousand in a population of two million is also calculated which might give an idea about the magnitude of the problem. Knowing that, not necessarily all those eligible do actually use the MOPH services, more opinions should be gathered as to the potential uses of this data set to generate reliable statistics.

**CHAPTER THREE:**

**Communicable, Maternal, Perinatal and Nutritional  
Conditions**

## 1. TUBERCULOSIS

### 3. DIARRHOEAL DISEASES

Resource/Study Population	Summary Findings	References	Appendix
The data are extracted from the hospital visa issuance center at the Directorate of Medical Care. This report covers the period from Jan 1, 2004 till Nov 30, 2004 (11 months).	Intestinal infectious diseases accounted for 2166 cases out of 93672 cases registered during the 11 months period.	MOPH. Department of Statistics. <i>Report</i> , December 2004.	Part of the main report.
In-and out-patient claims of all children who visited a hospital facility or underwent an ambulatory test and who were less than 20 years of age. Data covers the time period between January 1, 1995 and December 31, 2003.	Intestinal infectious diseases were the second leading cause of non-emergencies in infants and children up to 9 years old.	El-Zein S. Our children: select health care issues. <i>Center for Healthcare Information and Policy Studies (CHIPS)</i> , Bulletin 20, May 2004.	I-3.2
MedNet Liban Database. This database contains information about patients covered by public payers (NSSF), private insurance companies, mutual funds and self-funded schemes. It also includes all types of hospitals that are spread throughout Lebanon. This is an overview of hospital care during 1995-2001.	Intestinal infectious diseases accounted for the top cause of hospitalization in those aged less than one year with 21.2%, and 13.1 % for those aged 1-17 years old.	El-Zein S. Leading causes of hospitalizations and in-hospital mortality- an update. <i>Center for Healthcare Information and Policy Studies (CHIPS)</i> , Bulletin 17(2), December 2002.	I-3.3
Reports of three major health centers visits Malta organization-Kobayyet, Malta organization-Nabatieh, and AUB-University Health Services in the	Prevalence of diarrhea was as follows: 4% in Malta-Kobbayyet 3% in Malta-Nabatieh 3% in AUB-UHS	Nuwayhid I, Sibai A. Epidemiological review of selected diseases, injuries and risk factors in Lebanon: Background	I-3.4

year 1999		information for the National Burden of Disease Study. <i>Report</i> , WHO: Beirut, 2002.									
MOPH- ESU data 1998-1999.	Number of reported cases of Brucellosis was 286 in 1998 and 191 in 1999.	MOPH-ESU. <i>Epi News</i> , no. 7, Aug 2000.	I-3.5								
Descriptive analysis of all brucella cases reported to the ESU at the MOPH during 1997.	Incidence rate of brucellosis 8.1 per 100,000 (8.6 per 100,000 in males, 7.6 per 100,000 in females) Lebanon is endemic for brucellosis.	Kalaajieh WK. Epidemiology of human brucellosis in Lebanon in 1997. <i>Med Mal Infect</i> , 2000; <b>30</b> :1-4	I-3.6								
National Household Health Expenditure and Utilization Survey (NHHEUS) in 1999: a total of 6544 households representative of Lebanon were included (a weighted sample 32000)	5.2% of outpatient visits and 5.5% of hospitalized cases were due to infectious and parasitic reasons.	Ministry of Public Health (MOPH). <u>National Household Health Expenditure and Utilization Survey (NHHEUS)</u> . 1999	I-3.7 (complete copy of publication is provided)

## 6. RESPIRATORY INFECTIONS

Resource/Study Population	Summary Findings	References	Appendix
The data are extracted from the hospital visa issuance center at the Directorate of Medical Care. This report covers the period from Jan 1, 2004 till Nov 30, 2004 (11 months incidence).	Influenza and pneumonia accounted for 2043 cases, and acute upper respiratory infections, 676 cases out of a total of 93672 hospitalized cases in 11 months.	MOPH. Department of statistics. <i>Report</i> , December 2004.	Part of the main report.
In-and out-patient claims of all children who visited a hospital facility or underwent an ambulatory test and who were less than 20 years of age. Data covers the time period between January 1, 1995 and December 31, 2003.	Diseases of the respiratory system (Acute respiratory infections, pneumonia and influenza) are the leading causes of non emergencies in infants (M:57.72%; F:72.31%).	El-Zein S. Our children: select health care issues. <i>Center for Healthcare Information and Policy Studies (CHIPS)</i> , Bulletin 20, May 2004.	I-3.2
Multiple Cluster Indicator Survey 2000. to assess the state of children a sample of 2786 children less than 5 years of age were randomly selected at a national scale.	20% of the deaths in age 7 to 30 days are caused by pneumonia and 12% in those aged between 1 and 11 months.	Etude de l'état de l'enfant au Liban-MICS (2000) In: Recueil national des statistiques sanitaires au Liban. Edition 2004.	I-6.3
MedNet Liban Database. This database contains information about patients covered by public payers (NSSF), private insurance companies, mutual funds and self-funded schemes. It also includes all types of hospitals that are spread throughout Lebanon. This is an overview of hospital	Pneumonia and influenza constitute the 8 <sup>th</sup> top cause of hospitalization with 2.38% of discharged cases. And the third top cause in those aged <1 year (11.6%) and 1-17 years (7.9%)	El-Zein S. Leading causes of hospitalizations and in-hospital mortality- an update. <i>Center for Healthcare Information and Policy Studies (CHIPS)</i> , Bulletin 17(2), December 2002.	I-3.3

care during 1995-2001.			
Reports of three major health centers visits Malta organization-Kobayyet, Malta organization-Nabatieh, and AUB-University Health Services in the year 1999	Overall respiratory infections accounted for 19% of all visits to AUB-HS, 21% in Malta-Kobayyet and 63% in Nabatieh	Nuwayhid I, Sibai A. Epidemiological review of selected diseases, injuries and risk factors in Lebanon: Background information for the National Burden of Disease Study. <i>Report</i> , WHO: Beirut, 2002.	I-3.4
National Household Health Expenditure and Utilization Survey (NHHEUS) in 1999: a total of 6544 households representative of Lebanon were included (a weighted sample 32000)	12.4% of all hospital admissions were due to diseases of the respiratory system  22% of the surveyed individuals who visited an outpatient clinic in the past year did so for respiratory infections	Ministry of Public Health (MOPH). <u>National Household Health Expenditure and Utilization Survey (NHHEUS)</u> . 1999	I-3.7 (Copy of publication is provided)
Household survey of 4 areas (Baalbeck-Hermel, Akkar, Tirpoli, Batroun) each made of cluster of villages (more than 1000 children under five each). Survey on acute respiratory infections. Cough, per se, was the research topic.	In Akkar, Incidence of cough in the first 6 months of life is low, starts increasing after 6 months. In Akkar and Tripoli, 36.3 % of children had breathing difficulties (reported by their mothers). Compared to 42.7% in Baalbeck Hermel, and 32.6% as national average.	Preliminary report on the acute respiratory infections survey among children under five conducted in the regions of Baalbeck/Hermel, Akkar, Tripoli, Batroun and Koura. <i>Report</i> , 1993. UNICEF, Beirut	I-6.6

## 8. NUTRITIONAL DEFICIENCIES (IRON-DEFICIENCY ANEMIA)

Resource/Study Population	Summary Findings	References	Appendix
100 elderly 65 years and over, who are institutionalized for more than three months now were matched to 100 controls living at home. Area selected covered around 40% of the population.	Elderly at institutions had: -Higher mean dietary iron intake -Lower Body Mass Index Both groups had 100% RDA intake of energy, very low intake of vitamins A, D and alpha-tocopherol.	Sibai A, Zard C, Adra N, et al. Variations in nutritional status of elderly men and women according to place of residence. <i>Gerontology</i> , 2003; <b>49</b> : 215-224.	I-8.1
560 women of childbearing age and 310 children were selected from all over Lebanon. Blood samples were analyzed for serum ferritin and hemoglobin and plasma transferrin receptor.	23.1% of women and 24.8% of schoolchildren had deficiency hemoglobin levels. Iron stores were deficient in 26.7% of women and 25.4% in children. Iron deficiency anemia was in 47.8% of serum ferritin deficient women and 58.2% in children counterparts.	Hwalla-Baba N, and Adra N. Prevalence and selected determinant of iron deficiency anemia in women and under five children in Lebanon. Report submitted to MOPH and UNICEF. 1998	I-8.2

## **CHAPTER FOUR:**

### **Non-Communicable Diseases**

## 1. MALIGNANT NEOPLASMS: General

Resource/Study Population	Summary findings	References	Appendix																		
The data are extracted from the hospital visa issuance center at the Directorate of Medical Care. This report covers the period from Jan 1, 2004 till Nov 30, 2004 (11 months incidence).	The 11 month hospitalized cancer cases comprised the top of the list (12.6%) with 11826 cases out of the total. Breast cancer was the highest followed by cancer of the lymphoid, haematopoetic and related tissue.	MOPH. Department of statistics. <i>Report</i> , December 2004.	Part of the main report.																		
It is the first national population-based registry. It was established by the Lebanese Cancer Epidemiology Group which is a network of all hospitals with oncology specialists and all pathology laboratories. Data pertains to the year 1998.	4388 incident cases of cancer were reported and registered in the year 1998. Bladder cancer together with prostate and lung cancers topped the list for males with 18.5%, 14.2% and 14.1% respectively. Breast cancer topped the list for females with 33.4% followed by colorectal cancer with 8.6%. Crude incidence rate: males 141.4 per 100,000; females 126.8 per 100,000.	Shamseddine A, Mehio-Sibai A, Gehchan N, et al. Cancer incidence in postwar Lebanon: findings from the first national population-based registry, 1998. <i>Ann Epidemiol</i> , 2004: 1-6.	II-1.2																		
MedNet database. MedNet summed up 2688 cancer cases in all exposed to risk (covered population) from 1995 to 2003.	Prevalence of 228 cancer cases per 100,000. Probability of getting cancer is 2.1 per thousand for females and 2.4 per thousand for males The relative risk increases with age till 75 years then starts declining. Top 5 cancer sites by gender are as follows: <table border="1" data-bbox="537 1457 1062 1866"> <thead> <tr> <th>Rank</th> <th>Male</th> <th>Female</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Urinary bladder</td> <td>Breast</td> </tr> <tr> <td>2</td> <td>Prostate</td> <td>Colorectal</td> </tr> <tr> <td>3</td> <td>Lung and bronchus</td> <td>Ovary</td> </tr> <tr> <td>4</td> <td>Colorectal</td> <td>Lung and bronchus</td> </tr> <tr> <td>5</td> <td>Non-hodgkins lymphoma</td> <td>Thyroid/urinary bladder</td> </tr> </tbody> </table>	Rank	Male	Female	1	Urinary bladder	Breast	2	Prostate	Colorectal	3	Lung and bronchus	Ovary	4	Colorectal	Lung and bronchus	5	Non-hodgkins lymphoma	Thyroid/urinary bladder	El-Zein S. cancer: facts and trends. <i>MedNet Liban</i> , Bulletin no 23, October 2004.	II-1.3
Rank	Male	Female																			
1	Urinary bladder	Breast																			
2	Prostate	Colorectal																			
3	Lung and bronchus	Ovary																			
4	Colorectal	Lung and bronchus																			
5	Non-hodgkins lymphoma	Thyroid/urinary bladder																			

The Ministry of Public Health- Drug Dispensing Center. Statistics from its opening in 2000 till end 2003.	Cancer topped the list of medications distributed by the Ministry of Public Health with 39.1 % of the total number and 47.3% of the total cost of medications.	Statistiques de la Centrale de Distribution des Medicaments (2000-2003). In: Recueil National des Statistiques Sanitaires au Liban. Edition 2004.Pp.44-45.	II-1.4
Internal Security Forces data. It covers 22,372 hospitalizations for the personnel and their families	10.74 % of all discharge diagnoses were for cancer cases.	Direction Generale de la Securite Interieure: Service Medical (2002). In: Recueil National des Statistiques Sanitaires au Liban. Edition 2004.Pp.185-188.	II-1.5
National Cancer registry. Established as part of the Non Communicable Disease Program as a joint activity between the MOPH and WHO. Data for the year 2002 were published in their first report.	2124 cases were registered with an estimated coverage of 40% of incident cases. M/F ratio: 0.74 Top 2 cancers in males were: trachea-bronchial, lung (21.7%) and prostate (18.9%). Top 2 cancers in females were: Breast (49.7%) and ovary (7.3%).	MOPH, NCDP. National Cancer Registry, Lebanon 2002. <i>Report</i> .	II-1.6
Retrospective study aiming at determining the survival of cancer patients admitted to ICU between January 1998 and June 1999.	The majority of admissions were due to Cancer and/or treatment complications (59 out of 66 cases) and the mortality rate ranged from 41% during ICU recovery to as high as 83% at last to follow-up. No statistically significant difference in age.	Ghosn M, Kanso C, Kattan J, et al. Outcome of cancer patients admitted to the intensive care unit (ICU). <i>LMJ</i> , 2002; <b>50</b> (4):132-136.	II-1.7
The National Household Health Expenditure and Utilization Survey (NHHEUS) in 1999: a total of 6544 households representative of Lebanon were included (a weighted sample of 32000).	Reported prevalence of cancer at household= 0.3 % (0.2% in males;0.3% in females)  Cancer accounted for 12.7 % of all hospitalizations (107 cancer cases)	Ministry of Public Health (MOPH). <u>National Household Health Expenditure and Utilization Survey (NHHEUS)</u> . 1999	Copy of publication is provided.

## 11. CONGENITAL HEART ANOMALIES

Resource/Study Population	Summary Findings	References	Appendix
MOPH visa billing data during Jan 2004-Nov 2004.	114 cases of congenital anomalies of the heart were hospitalized during the 11 months period.	MOPH, Department of Statistics. Unfinished report, 2004.	
Relationship between congenital heart defects and consanguinity was investigated. 759 Lebanese patients with different types of congenital heart malformations were selected from the cardiac registry center at the AUBMC.	397 were males. Rate of consanguineous parental marriages was 34.7%. Significantly increased rate of consanguinity in all categories of cardiac malformations except great vessel and coronary artery lesions.	Nabulsi M, Tamim H, Sabbagh M, et al. Parental consanguinity and congenital heart malformations in a developing country. <i>American Journal of Medical Genetics</i> , 2003; <b>116A</b> :342-347.	II-11.2
A leading article about pediatric cardiology in Lebanon.	Adults between 18 to 71 years who have CHD are an emerging population. In 206 patients admitted to surgery Atrial Septal Defect was the most common cardiac malformation accounting for 53.4%, followed by Ventricular Septal Defects (11.2%).	Bitar F, Sabbagh M, and Obeid M. The status of pediatric cardiology in Lebanon. <i>Leb J Med Sci</i> , 2003;No10:4-9.	II-11.3
MedNet Liban Database. This database contains information about patients covered by public payers (NSSF), private insurance companies, mutual funds and self-funded schemes. It also includes all types of hospitals that are spread throughout Lebanon. This is an overview of hospital care during 1995-2001	In the MedNet experience, 22.3 % of deaths less than one year of age are caused by congenital anomalies of the heart and circulatory system	El-Zein S. Leading causes of hospitalizations and in-hospital mortality- an update. <i>Center for Healthcare Information and Policy Studies (CHIPS). Bulletin</i> 17(2), December 2002.	I-3.3
The National Collaborative Perinatal Neonatal	64 cases of 1279 admissions (5%) had Congenital Heart Disease.	NCPNN. First Annual report (April 1 <sup>st</sup> , 1999-Mar 31 <sup>st</sup> ,	I-7.6

<p>Network (NCPNN) was designed to achieve a system of continuous and prospective data collection covering all newborn infants-and their mothers-who are admitted to the normal and intensive care nurseries of hospitals participating in the network</p>		<p>2000)</p>	
<p>a retrospective review of newborns with Congenital Heart Disease (CHD) during the year 1996, and a prospective evaluation of all pediatric patients admitted to the pediatric cardiology service between the first of March, 1997 and 31<sup>st</sup> of January, 1999</p>	<p>The incidence of CHD at the AUB-MC was 11.5 per 1000 live births; and, out of 670 with cardiac anomalies registered at CCRC, 613 (91.5%) had CHD and the rest had Acquired Heart Disease (AHD). More than half (59.2%) of CHD were of more than 1 year of age with 10.6% aged less than one month. The Mortality rate in CHD patients was 4.2% as compared to 3.5% in those having AHD.</p>	<p>Bitar F, Obeid M, Alam S, et al. The Children's Cardiac Registry Center (CCRC), Epidemiology of Cardiac Disease in Children in Lebanon, the American University of Beirut-medical Center Experience, March 1, 1997-January 31, 1999.<i>Study</i></p>	<p>II-11.6</p>
<p>Monitoring the surgical treatment of Congenital Heart Disease in Lebanon between 1993 and 1995, 455 cases of CHD were studied.</p>	<p>455 consisted 12% of all cases covered by MOPH. Most frequent CHD were: Ventricular Septal Defects (20%), Atrial Septal Defect (24%, quite elevated value), Tetralogy of Fallot (17%), and Patent Ductus Arteriosus (8%, elevated).</p>	<p>Abou Charaf L, Timani N, Hajj Ali W, et al. ## 17. BACK PAIN

Resource/Study Population	Summary findings	References	Appendix
Three independent observational studies (1997-1999) to assess the prevalence of low back pain (as self reported) via a questionnaire among: 1035 adults (random sample from a national household survey sample fame) 633 nurses from 4 hospitals 201 employees out of 3800 population	54 % of nurses 50% of employees reported back pain  13.1% was the point prevalence of low back pain  Mean age 41.8%  53.7% reported a specific diagnosis. Degenerative spine disorders ranked first representing 80.9%.  Surgical treatment reported in 12.5% of cases.	Baddoura R. Low back pain in Lebanon: a hint on the magnitude of the problem, <i>Cochrane Library</i> , 2000: 17.	II-17.1
A questionnaire was sent to hundreds of physicians (who might manage back pain) to inquire about he last 5 consecutive ambulatory patients with LBP they treated. A total of 233 physicians responded.	Bed rest was prescribed in 37.8% of cases. Surgical treatment was offered for 10%. Sick leaves were prescribed in 54.1% of the cases with average duration of 12 days.	Baddoura R. Low back pain in medical practice. <i>Cochrane Library</i> , 2000: 7-8	II-17.2
A review of back pain reported by all AUB employees registered under the University Health services.	Back pain was the second most important reason for sick leaves (7.9%)	Bou Khalil T, and Doudakian R. Back pain at the American university health services. <i>Cochrane Library</i> , 2000: 12	II-17.3
National Household Health Expenditure and Utilization Survey (NHHEUS) in 1999: A total of 6544 households representative of Lebanon were included (a weighted sample of 32000).	6.5 % reported low back pain (5.3% males; 8.6 % females)	Ministry of Public Health (MOPH). <u>National Household Health Expenditure and Utilization Survey (NHHEUS)</u> . 1999	Publication provided

The prevalence of back pain among nurses working at the AUBMC in 1994 was assessed through a self-administered questionnaire.	66% reported low back pain 12% upper back pain 21% both upper and lower		Nuwayhid et al. (1994)	Not found	
Assessed back pain among students in one or two schools: one questionnaire completed by 706 students and another for their parents	57% of school children who carry school bags experience back pain 56% boys One third of those who experience back pain sought medical advice		Ghoussoub K et al. (2000)	Not found	
Medical record review for the last 10 years on 638 employees	Average annual incidence of back pain sick leaves is 8.7%. higher frequency in males, longer leaves for females.		Khalili A. Low back pain at the tobacco national agency: a retrospective study. Lebanese GP association, 2000.	Not found	

## 18. OSTEOPOROSIS

Resource/Study Population	Summary findings	References	Appendix
A randomly selected sample of 25-35 years old (because peak BMD is reached at age 35) individuals from the greater Beirut area. The study was conducted in Fall 1999 on 213 eligible subjects.	Prevalence of fractures in postmenopausal women after age 50 is 11%. Peak mean bone mineral density (BMD) was 6%-13% lower in women than in men. 70% of the study sample drank coffee more than occasionally, only 27% exercised regularly.	El-Hajj-Fleihan G, Baddoura R, Awada H, et al. Low peak bone mineral density in healthy Lebanese subjects. <i>Bone</i> , 2002; <b>31</b> (4):520-528.	II-18.1
Arabic version of EULAR questionnaire was administered to a random sample of general population (n= 1003) of 50 years of age. Mean age 61.3 years and F/M sex ratio 0.9 Osteoporosis was identified by the presence of any type of fractures occurring after 50 years of age	-Mean age 61.3 years -F/M ratio 0.9 -Prevalence of osteoporotic fractures: 11.1 % (8.7% in males; 13.4% in females) -increased prevalence with age only with hip and vertebral fractures Lifetime risk of hip fractures for 50 years or more 2% -low prevalence of osteoporotic fractures	Baddoura R, Okais J, & Awada H. Incidence of fractures after the age of 50 years in the Lebanese population and implications in terms of osteoporosis. <i>Rev Epidemiol Sante Publique</i> , 2001; <b>49</b> (1):27-32.	II-18.2 (available online)
Bone mineral density measured on a sample of 1023 individuals (165 males and 858 females) aged 20-79 years to assess BMD levels of the Lebanese and compare it with European and US standards	Spine BMD values of Lebanese women were generally lower (by 8% for ages 20-59, and by 5-6% for ages 60-79). Height was not significantly associated with BMD. Prevalence of osteoporosis is overestimated when using US/European standards.	Maalouf G, Salem S, Sandid M, et al. Bone mineral density of the Lebanese reference population. <i>Osteoporosis Int</i> , 2000; <b>11</b> :756-764.	II-18.3
39 osteoporosis patients on Fosamax therapy. 11 healthy Lebanese women at menopausal age, contacted by phone. Total sample 50.	The majority of patients (78%) continue on taking their medication after 11 months. 87% of them have complied with the prescription and the conditions of intake.	Atik M. Evaluation de la compliance a l'Alendronate dans le traitement de l'osteoporose. These, USJ, 1997-1998.	II-18.4

## 19. DEPRESSION

Resource/Study Population	Summary findings	References	Appendix						
Prospective follow-up study based on questionnaires and done 24 hrs and 3-5 months postpartum done with 396 women in maternity wards in 9 selected hospitals in Beirut.	An association was found between smoking in pregnancy and Post Partum Depression Odds Ratio 1.2 (95%CI:1.05-1.445)	Yazbeck JC, Yahya F, and Tarrabay M, et al. Postpartum depression: another reason to quit. <i>SPM project</i> , AUB, 2002.	II-19.1						
93 subjects (33 victims of explosions and two non-victim control groups of 30 each) were assessed for stressors experienced, and depression among other things.	39 % met the PTSD diagnostic criteria, 51% of them were depressed. These results were significantly higher than in the controls.	Farhood L, and Nouredine S. PTSD, depression, and health status in Lebanese civilians exposed to church explosion. Paper presented at the first international nursing conference in Lebanon, AUB, 1999.	II-19.2						
438 families chosen at random	Perceived war and non-war stressors were associated with less effective family adaptation in terms of increased symptomatology in depression and other psychiatric conditions.	Farhood L. Testing a model of family stress and coping based on war and non-war stressors, family resources and coping among Lebanese families. <i>Archives of Psychiatric Nursing</i> , 1999;13(4):192-203. Males	14.7						
Females	23.1						
٥٤٠ Lebanese families chosen by random from West Beirut in 1987 Depression diagnosed using the Beck Depression Inventory (having at least 4 symptoms for at least one month)	Prevalence: 9.9% Highest rate in the 40-59 year age group.	Farhood L, Zurayk H, Chaya M, et al. The impact of war on the physical and mental health of the family: the Lebanese experience. <i>Soc Sci Med</i> , 1993; <b>36</b> :1555-1567.	II-19.7				
١٢٤ children (88% of them Lebanese) from 8 schools in Lebanon (Beirut, Southern suburbs of Beirut, Saida). Depression Symptoms were elicited using the child Behavior Inventory (CBI) (unpublished project for the Center for the study of Human Rights at Columbia University)	Children experiencing separation from their parents had more symptoms of depression than those experiencing other war-related events.	Macksoud M, and Aber JL. The war experiences and psychological development of children in Lebanon. <i>Project on children and war (draft)</i> . Center for the study of human rights. Columbia University, 1991.	II-19.8				
١٩٢ women (20-53 years old) selected at random for being mothers of 152	Interviewed mothers were on average mildly depressed scoring 11.31 on Becks Depression Inventory scale with a range of 0 to	Bryce J, Walker N, Ghorayeb F, et al. Life experiences, responses, styles, and mental health	II-19.9				

children from 3 schools (1985-1986) Mothers interviewed and depression diagnosed using the Beck Depression inventory	33.	among mothers and children in Beirut, Lebanon. <i>Soc Sci Med</i> , 1989;28(7):685-695.	
Description of 4636 patients who constituted 95% of the patients seen by 20 out of the 21 psychiatrists and 3 out of the 3 psychiatric hospitals in Lebanon in 1964 Patients were reported to the authors by these psychiatrists based on their diagnosis of depression.	-Point prevalence = 3 per 100,000 Males (2.2 per 100,000) and Females (3.7 per 100,000). - The 6-month incidence rate= 9.5/100,000 8.4 (Males) and 10.6 (Females)	Katchadourian M, Racy J. The diagnostic distribution of treated psychiatric illness in Lebanon. <i>Brit J Psychiatry</i> , 1969;115:1309-1322.	II-19.10
Follow-up of 12 students from AUB 12 days before and 8, 37 and 316 days after exposure to significant war event Diagnosis of depression using the Beck Depression Inventory	High level of depression 8 days after trauma. Level of depression decreases with time (at 37 and 316 days after trauma).	Saigh P. Anxiety, depression and assertion across alternating intervals of stress. <i>Journal of Abnormal Psychology</i> , 1988;97:338-341.	Journal not found

## 20. SCHIZOPHRENIA

Resource/Study Population	Summary findings	References	Appendix
The medical charts of 230 patients admitted at Al-Fanar hospital (South) between 1971 and 1986 for the first time and diagnosed as schizophrenics. 40 were selected at random and interviewed.	76% were unemployed. 69.5% were single.	Yaktin US, and Labban S. Traumatic war. Stress and schizophrenia. <i>J Psychosoc Nurs Ment Health Serv</i> , 1992; <b>30</b> (6):29-33.	Original source not found  Abstract provided  II-20.1
The purpose was to assess the prevalence rate, profiles, and subtypes of schizophrenia in Lebanon. For this purpose the medical charts of 6988 patients admitted to Deir as-Salib Hospital (1980-1990) were reviewed.	Out of 276 schizophrenics: -45.5% of all admissions. -55% had paranoid schizophrenia -82% were single -Age at onset 20.5 years -M/F =2.44	Hachem DG (1996). Data published in Nuwayhid I, and Sibai A. Epidemiological review of selected disease, injuries and risk factors in Lebanon: Background information for the national burden of disease study, FHS, AUB, Jan 2002.Pp:168-169.	Original source not found  II-20.2
February 1964 – August 1964: A survey of all 4636 patients seen by 20 out of the 21 psychiatrists and 3 out of the 3 psychiatric hospitals in Lebanon. Schizophrenia diagnosed clinically by the participating psychiatrists. 'Schizophrenia', 'paranoia', and 'paranoid states' were lumped into one category called 'schizophrenic reactions'.	837 patients were identified. Overall prevalence= 39.2 per 100,000 73% in lowest income group 67% unmarried, 24% married	-Katchadourian HA, Sutherland JV. Schizophrenic disorders in Lebanon. <i>J Med Liban</i> , 1975; <b>28</b> (1):143-157. -Katchadourian HA, Sutherland JV. Affective psychosis in Lebanon. <i>J Med Liban</i> , 1975; <b>28</b> (1):159-167.	II-20.3

## 21. SUBSTANCE ABUSE

Resource/Study Population	Summary findings	References	Appendix
A complete assessment of substance abuse in different at risk populations (especially university students from AUB, LAU, LU and USJ), provided as part of the report on Rapid Assessment Survey done in Lebanon by the organization IDRAC as asked by the UNODC.	Prevalence of ever use as reported by freshmen and sophomore students in AUB Beirut was 12% for illegal drugs, 10.2% for sedatives, 66.5% for alcohol.	IDRAC and UNODC. Substance use and misuse in Lebanon, the Lebanon Rapid Situation Assessment and Responses Study. <i>Final Report</i> , May 2003.	II-21.1 (original publication provided)
119 patients underwent surgery for gallstones disease. 79 patients included in analysis.	15 different antibiotics were used and 56% of patients were prescribed oral antibiotics on discharge. Erratic use of antibiotics.	Khalifeh N, Kanafani Z, Araj G, et al. Antibiotic use in acute cholecystitis: retrospective review of 79 cases. <i>Leb J Med Sciences</i> , 2003; <b>no.10</b> :21-23.	II-21.2
Secondary multivariate analysis on the National Household Health Expenditure and Utilization Survey 1999 population, carried out on two of the frequently used medications.	72.2% reported the use of any medication. 60.4% reported using analgesics and 15.2% antibiotics.	Makhlouf Obermeyer C, Schulein M, Kasparian C, et al. Medication use, gender, and socioeconomic status in Lebanon. Analysis of a national survey. <i>LMJ</i> , 2002; <b>50</b> :216-225.	II-21.3
Of all 1643 charts in the psychiatry and psychology inpatient unit at Saint Georges Hospital, which was founded in 1979, 222 (13.5%) who had a past/present history of substance abuse were reviewed.	64.9% had comorbid psychiatric disorders with specific relations between individual substances and psychiatric diagnoses.	Karam E, Yabroudi P, and Melhem N. Comorbidity of substance abuse in acute general psychiatric admissions. A study from Lebanon. <i>Comprehensive Psychiatry</i> , 2002; <b>43</b> (6):463-468. ## RISK FACTORS: 2. Obesity

Resource/Study Population	Summary findings	References	Appendix																											
To estimate the prevalence of obesity and examine associated covariates. The anthropometric measurements and dietary assessments of 2104 individuals (900 males and 1204 females) 3 years of age or older were done.	For children 3 to 19 years of age, prevalence of obesity was 3.2% for girls and 7.5% for boys. In contrast, obesity (BMI $\geq$ 30) was higher in women (18.8%) than men (14.3%). Mean BMI by age and sex: <table border="1" data-bbox="441 499 1032 842"> <thead> <tr> <th></th> <th>Males</th> <th>Females</th> </tr> </thead> <tbody> <tr> <td>3-9 years</td> <td>16.1</td> <td>16.0</td> </tr> <tr> <td>10-19</td> <td>20.5</td> <td>20.5</td> </tr> <tr> <td>20-29</td> <td>24.5</td> <td>22.9</td> </tr> <tr> <td>30-39</td> <td>25.9</td> <td>25.0</td> </tr> <tr> <td>40-49</td> <td>26.8</td> <td>27.2</td> </tr> <tr> <td>50-59</td> <td>27.2</td> <td>28.8</td> </tr> <tr> <td>60-69</td> <td>26.2</td> <td>29.7</td> </tr> <tr> <td>70+</td> <td>25.5</td> <td>27.6</td> </tr> </tbody> </table>		Males	Females	3-9 years	16.1	16.0	10-19	20.5	20.5	20-29	24.5	22.9	30-39	25.9	25.0	40-49	26.8	27.2	50-59	27.2	28.8	60-69	26.2	29.7	70+	25.5	27.6	Mehio-Sibai A, Hwalla-Baba N, Adra N, et al. ## RISK FACTORS: 5. Dietary Habits/Fiber Consumption

Resource/Study Population	Summary findings	References	Appendix
Review of surveys done and data collected by author.	Growth retardation in low social classes is common. Change in lifestyle and dietary habits caused proliferation of chronic diseases.	Hwalla-Baba N. Dietary intake and nutrition related disorders in Lebanon. <i>Nutrition and Health</i> , 2000; <b>14</b> :33-40.	IV-5.1
Review of trend in food consumption and comparison between the 1960's and present.	Percentage contribution of cereals to daily caloric intake has dropped and was replaced by high fat items. In 1960's cereals formed more than half of daily energy intake.	Hwalla-Baba N. Food and dietary fiber consumption pattern in Lebanon. <i>International Journal of Food Sciences and Nutrition</i> , 1998; <b>49</b> :S41-S45.	IV-5.2
Review of food consumption patterns in Lebanon and comparison between the 1960's and 1992	Average daily caloric intake is 3144 Kcal. 36.4% cereals, 15% animal proteins, 14% fruits and vegetables. Bread was mostly consumed item with 48% of daily intake in 1965. At present forms around 30% of energy intake.	Hwalla-Baba N. Food consumption pattern in Lebanon. <i>Revista Di Antropologia (Rome)</i> , 1998; <b>76S</b> :193-204.	IV-5.3

## **CHAPTER SEVEN:**

### **Conclusion and Recommendations**

## **Conclusion and Recommendations:**

The regular assessment of population health is a key component in monitoring the wellbeing of a country. The simplest and most widely used method for producing population health statistics is to aggregate data on individuals in order to generate statistics such as the proportion of the population suffering from a given health problem, or in a certain state of health, or even the number of individuals who die from a particular cause.

In Lebanon, measures of incidence, prevalence and mortality are lacking. The reason lies in the insufficiency of reliable estimates on population denominators, coupled with an incomplete vital registration system, which makes it difficult to correctly assess the epidemiological situation of health conditions.

In a classical report, very much place is devoted to the opinion of the authors and a certain analysis of the research findings. This, however, is a compiled literature work, which is directed to professionals in the field of health research and policy and those interested in research gaps, to derive their own conclusions. Nevertheless, I tried to add to the collection of articles, some summary of findings for quick review. This report, up to my knowledge and based on available information, is “concise” but “informative”. Even so, a critique has to always emerge, especially when the research review does not stick to the opinion of prioritizing certain health problems. In that respect, some health problems, which were rated to be of priority, turned out to have low prevalence in the population samples studied. To be able to see the true burden of those health problems, in-depth studies should be undergone.

In that respect, no National Burden of Disease can be assessed without representativeness. So far, the limited, small scale research studies have proven to be, either old, or not representative for the whole population; and, very few of the pictures that were given were consistent when comparing different resources.

Two recommendations are of utmost importance and priority: The first, is that to be able to run research on selected health topics of interest, a reliable sampling frame needs to be set, so that any bit of research done will be as part of a national sample, and thus generalizability to the whole population can be done. The second crucial issue when talking about a NBOD study, is mortality data and cause of death recording. Automation of death certificates has to happen at the Ministry of Public Health. The current situation in Lebanon is that the deaths are registered in the Ministry of Interior as part of the vital registration system. This would be justified to monitor changes in population numeration as a whole. Nevertheless, cause of death, and hence the load of mortality of specific diseases and the contribution of risk factors to mortality, are primarily important from a health policy and planning standpoint; and thus, the involvement of the Ministry of Health in cause of death coding stems from its immediate realm of interests. Accordingly, coders that are to be hosted at the Ministry of health have to be trained on the proper coding system that is compatible with the Global Burden of Disease categorization. The other alternative would be to strengthen the vital registration systems in terms of cause of death recording and there are lots of efforts that were done worldwide that verse into that domain.

These two basic criteria are fundamental building blocks to be able to come up with estimates of morbidity and mortality of appropriate quality to be able to run a National Burden of Disease study, and derive reliable estimates of DALYs.

Until then, it would be a more realistic goal to run a hospital-based burden of disease study. It is realistic because hospital data are relatively small scale compared to population data, and assessment of cause of death can be even more reliable than vital registration systems. In that way, there is a potential possibility to get complete information about the tip of the iceberg, in terms of the most severe health conditions; certainly, taking into consideration matters of accessibility and availability. Accordingly, the findings will be directed at assessing the situation of policy issues relating to the need/no need of medical technologies that are proliferating at the curative side of services at a high cost, and hence jeopardizing the expenses on low cost preventive services.

Population denominators, though, remain unknown...
